About SmiTriX

Contents

SmiTriX was not planned as a product. It started as a tiny app built for exactly one user: me.

I wanted three things at the gym: log my workouts, track my body weight, and see whether any of it was going anywhere. Every app I tried wanted a subscription, an account, or my training data on someone else's servers, and usually all three. So I did the homelab thing: built a small mobile web page, put it on my own server, and started logging.

It turns out a tracker you build for yourself gets sharpened in a way products don't. Every awkward tap at the squat rack became that evening's fix. The guided workout flow, the weight pre-fills, the rest timer, the ritual of asking for body weight before the first set: none of that came off a feature list. It came from standing in the gym with the thing in my hand.

Then friends wanted in. That brought passkey profiles, so everyone signs in with a fingerprint and keeps their own data, and sync, so the log survives any phone. Somewhere along the way the little page was rewritten into a proper React app, learned 14 languages, grew a muscle map that reads three ways (where the volume went, what is still recovering, and what each muscle is actually strong at), picked up importers for FitNotes, Strong, Hevy and Apple Health, and finally became a native Android app you can install from this site.

In July 2026 I open-sourced the whole thing under the **AGPL**. The license is the point, not a footnote: your training data should be yours, the software that holds it should be inspectable, and nobody, me included, should be able to take a closed, paid version of it away from the community.

SmiTriX still runs on the same homelab server it started on, and I still log every session with it. That is the quality bar: I am the first user of every release.

Milestones

The personal app

early summer 2026

A hand-written vanilla-JS page on my own server. One user, zero ambitions.

Contents

v1.0.0 — open-sourced

July 20, 2026

Docker Compose self-hosting, passkey profiles, guided workouts, a 1,324-exercise library. AGPL from day one.

Every release since

ongoing

See the full list on GitHub or GitLab.

Principles

- **Your data is yours.** Local-first, one-file backups, no lock-in. Leaving SmiTriX must always be one export away.
- **No telemetry, ever.** If a feature needs analytics to justify itself, it does not ship.
- **Dependency-light.** The backend is one Node file with a single dependency; the frontend is React, a router and a store. Small enough to actually audit.
- **Open source that stays open.** AGPL-3.0, so every fork and every hosted version owes its code back to everyone.
