Accent:

Features

Built on the gym floor.

Every feature here exists because something was awkward between two sets. Nothing is here to sell you anything.

Progression that follows a rule

Linear, Greyskull LP, double progression or added time, set per routine and overridable per exercis
the session opens, and each one tells you where it came from.

An AI coach, if you want one

Optional, off by default, and it runs on whatever AI you bring — an Anthropic, OpenAI or Gemini key, any
such as Ollama on your own network, or a Claude Code / Codex runtime in the container. Nothing it pro
every change carries its reason and can be undone.

Plan	Review	Private

A week of routines from a few questions: goal, days, session length, equipment, limits.

Reads what you actually logged — stalls, effort, body weight — and proposes changes with the evidence.

AND THE REST OF IT

Sixteen more things it does.

Weekly plan

A routine per weekday. Any single day can be moved when life happens, without editing the plan itself.

Weeks start where you say

Monday or Sunday. The plan, the day strip, the calendar and every “this week” total move with it, so the app reads like the calendar you already use.

Screenshots

Five screens, and that's the app.

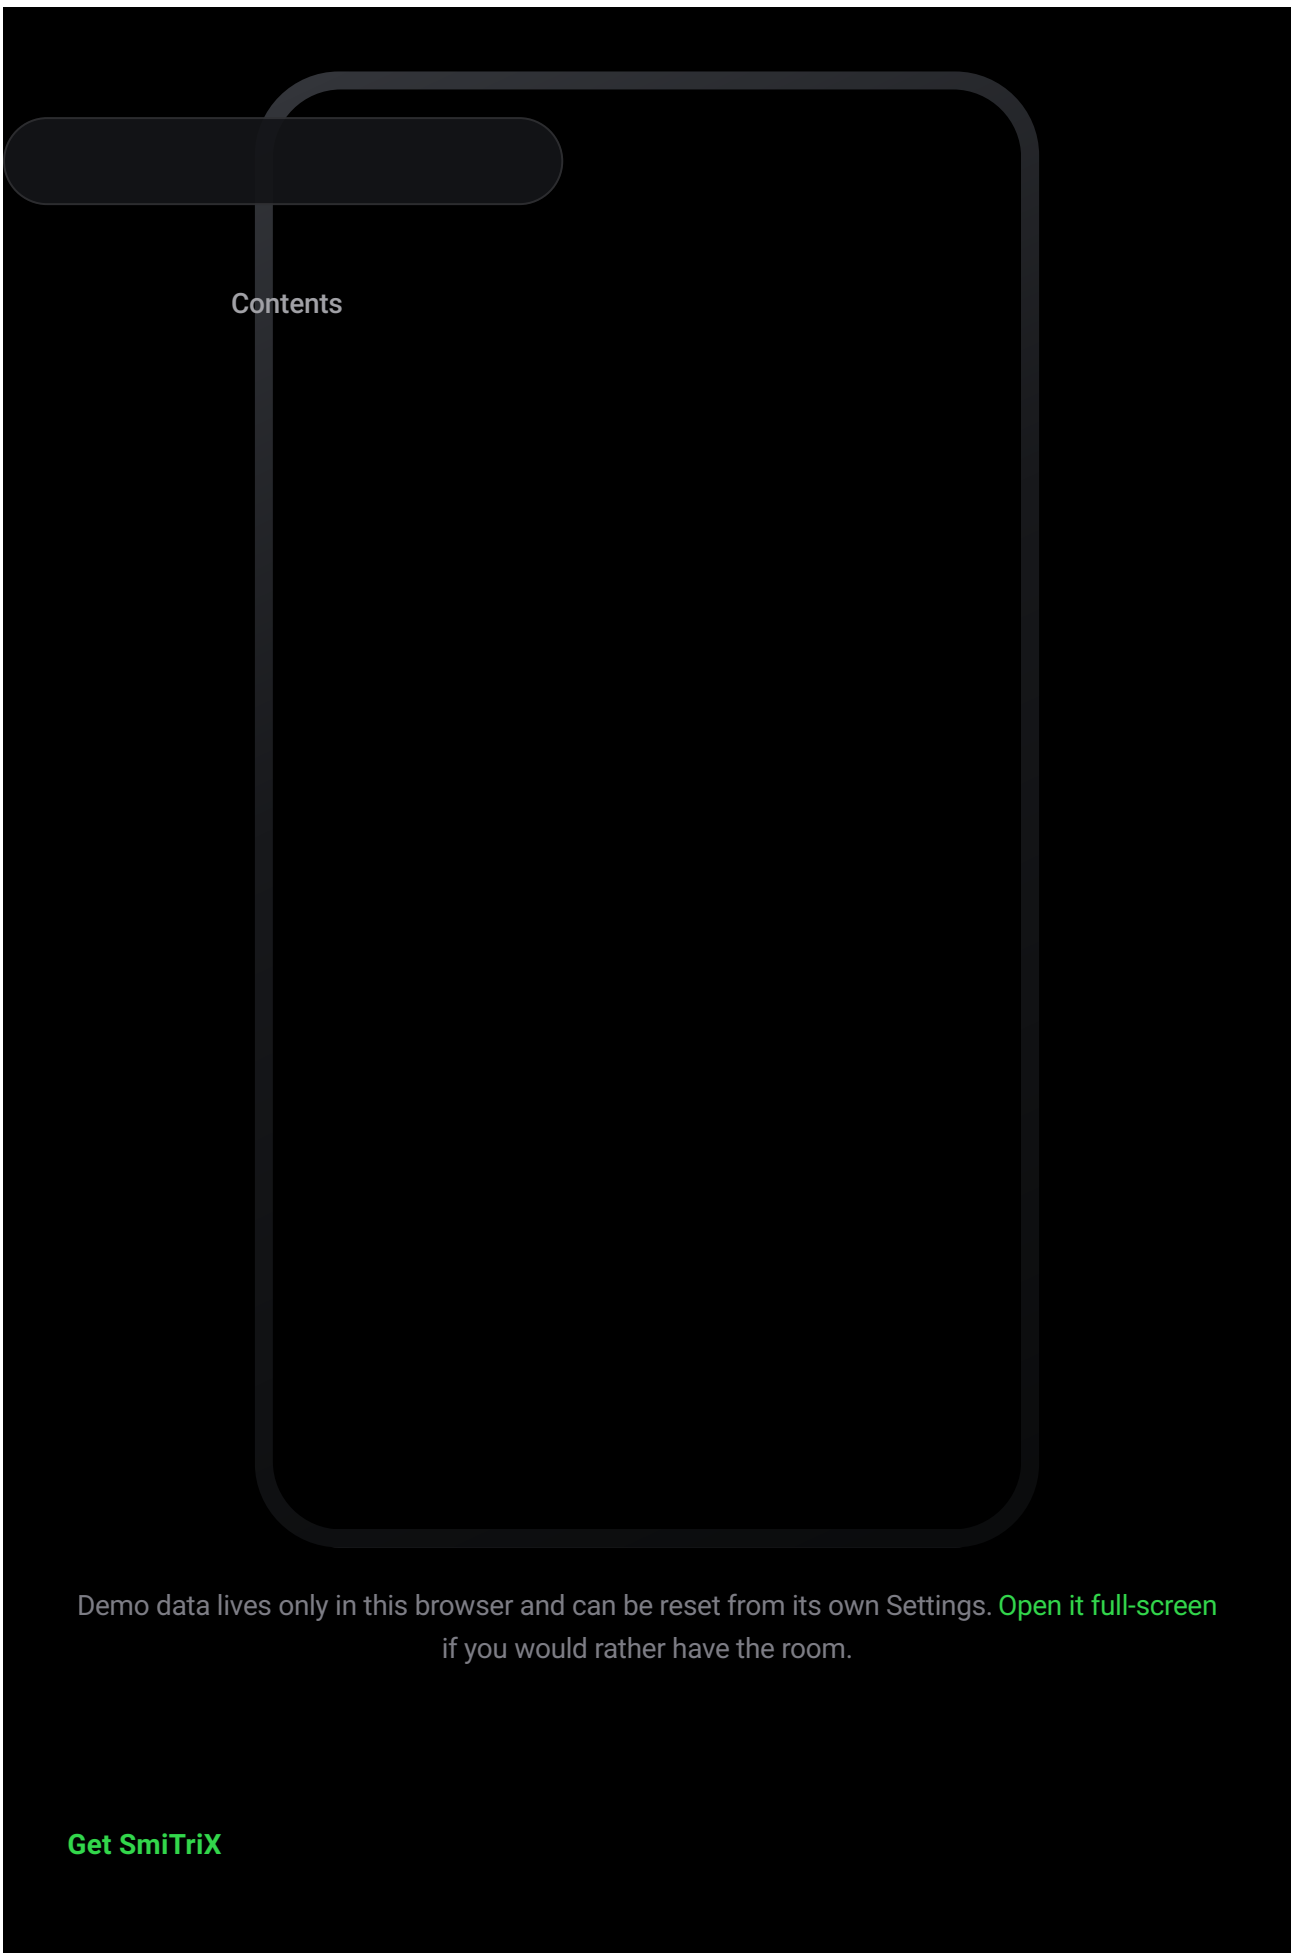

Home Workout Stats

Swipe through them or select a tab above.

Live demo

Try it right here.

The real app with a seeded example history, running in your browser. Start a workout, break something, change anything you like.

Demo data lives only in this browser and can be reset from its own Settings. Open it full-screen if you would rather have the room.

Get SmiTriX

One app, two flavors.

Same codebase. The choice is where your data lives: entirely on your phone, or on a server you control.

Contents

Mobile app

For anyone. Install it and you are done.

- ✓ Everything stays on your phone
- ✓ No account, no server, no setup
- ✓ Native workout-day reminders
- ✓ Backups through the share sheet
- — No sync across devices

v1.3.8 · 27.7 MB · Android 6.0+ · signed APK. Your browser will ask before installing; that is normal outside the Play Store.

Every release is also built and signed by CI and attached to the GitHub releases page, checksums and all.

On iPhone? Apple does not allow installs outside the App Store. Use the self-hosted version as a home-screen app instead, or see the docs.

SmiTriX started as **a tiny app I built for myself.** I wanted to log my workouts and my weight without a subscription app claiming my training data. Then friends wanted in, and it grew a mind of its own.
